Antenna arrangement

Abstract:

An improved antenna arrangement has the following features:

- the at least two antenna element systems (3.1, 3.2) are arranged and/or fed such that the main lobe (7.1) of the first antenna element device (3.1) and the main lobe (7.2) of the second antenna element device (3.2) include an angle (α) between one another,
- a network (13) is provided via which the first antenna element system (3.1) and the second antenna element system (3.2) can be supplied with a signal whose intensities can be set differently relative to one another, so that it is possible in this way to set a different angular transmission direction (α) for the antenna arrangement.
